TABLE OF CONTENTS

1.0 INTRODUCTION

The subject property is known as Block 2, Lot 2, Parcel P6 2 2 0204, in the City of Bethlehem, Ward 17, Northampton County, Pennsylvania. The site is located on a portion of the historic Bethlehem Steel Ore Yard, near the Minsi Trail Bridge and a portion of the Bethlehem Steel site to the west of the bridge. Parcel P6 2 2 0204 consists of approximately 91 acres.

The Las Vegas Sands Corporation intends to construct an entertainment complex which will include a casino, restaurants, commercial recreation facilities, retail use, and 300 hotel rooms. This is a preliminary assessment of the potential impact of the proposed entertainment complex on the City of Bethlehem's water distribution system, storm sewer and sanitary sewer systems. This report is based on an analysis of information made available through the City of Bethlehem, Bethlehem Steel, in-house files and conversations with various city and state officials.

2.0 EXISTING UTILITIES INVENTORY AND EVALUATION

A. Sanitary Sewer

The City of Bethlehem's sewer service area includes all of the City of Bethlehem, the Borough of Fountain Hill, the Borough of Freemansburg, Hanover Township – Northampton County, the Borough of Hellertown and portions of Bethlehem Township, Hanover Township – Lehigh County, Lower Saucon Township, Salisbury Township, and the City of Allentown. The City of Bethlehem owns, operates, and maintains a wastewater collection and conveyance system and a wastewater treatment plant (WWTP). Conveyance facilities include approximately 208 miles of gravity sewer lines and the City maintains 46.3 miles of sewer lines in Hanover Township – Northampton County. The population served by the City's WWTP is more than 115,000 with over 25,000 sewer accounts.

Joseph Mari, Project Engineer, who has been with the City of Bethlehem's Engineering Department for over 42 years, stated in an interview that the City's waste water treatment plant went on line around 1952 and was rated by the Pennsylvania Department of Environmental Protection (PADEP) to process 20 million gallons of sewage per day (MGD). The PADEP later dropped the rating from 20 million to 15.5 million after the Bethlehem Steel Plant stopped production. The steel plant was producing about 5 MGD when it was in full operation.

The proposed entertainment complex project which will include a casino, 300 hotel rooms, restaurants, commercial recreation facilities and retail uses will generate approximately 125,000 gallons per day (GPD) of wastewater. This is significantly less than Bethlehem Steel's 5 MGD for which the systems were designed. French and Parrello Associates, P.A. (FPA) worked in conjunction with Pete Hepler of the City of Bethlehem Engineering Department to calculate the flows. Mr. Hepler stated the City's WWTP has about 400,000 GPD of wastewater treatment capacity reserved for the City of Bethlehem for future allocation as of November 3, 2005. A Sewage Facilities Planning Module Application has been submitted to the City for approval (see Appendix A). The WWTP has the capacity to treat the projected flows from the proposed entertainment complex; therefore the project should have no impact on the City's WWTP.

The City of Bethlehem owns and maintains existing sanitary sewer facilities near the project area. See sanitary sewer maps in Appendix A. A 42" Reinforced Concrete Pipe (RCP) runs through the proposed site near the Minsi Trail Bridge. The 42" pipe connects to a 66" RCP which conveys the waste water by gravity to the WWTP about 1.5 miles from the project site. The close proximity to the plant and the fact that the project site is uphill from the plant would suggest at this time that there is no need of a pump station onsite.

The existing sewer system for the former Bethlehem Steel Plant which connects to the City collection system consists mostly of cast iron pipes. To avoid infiltration and inflow problems and ensure approval from the City, Mr. Mari recommends not incorporating any existing onsite sewer pipe into the design of the new sewer system. Cast iron is not an approved pipe material for the construction of new sanitary sewer systems in the City of Bethlehem. This should not be an issue for the design of the site, since any existing abandoned sewer pipes on the site will be removed.

The proposed entertainment complex will have the option of connecting to the existing 42" or the 66" sewer line. During the process of evaluating and designing the sewer system during site plan preparation, the best connection point can be determined. The nearby 42" and 66" sanitary sewer system have an adequate conveyance capacity and the anticipated flows from the proposed entertainment complex should have no negative impact on the City's sanitary sewer collection infrastructure.

B. Potable Water

The City of Bethlehem water system is owned and operated by the City. The City of Bethlehem's water comes entirely from surface sources, namely the Wild Creek Reservoir, Towamensing Township, Carbon County, in a watershed that covers 22 square miles and the Penn Forest Reservoir, Penn Forest Township, Carbon County and Polk Township, Monroe County, in a watershed that covers 17 square miles. This primary water supply is located 22 miles north of the City.

The Tunkhannock Creek, Tunkhannock Township, Monroe County provides a supplemental supply to the Penn Forest Reservoir. The Bethlehem Authority owns approximately 13,600 acres around the Wild Creek and Penn Forest Reservoirs and approximately 9,000 acres around the Tunkhannock Creek and restricts any activities on these lands that could contaminate these water supplies. There is no public access, such as boating, allowed on these reservoirs. Dual transmission mains can carry up to 47 million gallons of water per day to the City's water filtration plant in Lehigh Township and from there to the distribution system. Appendix B contains a copy of the Will Serve Request letter sent to the City of Bethlehem Engineering Department, for potable water service to the site.

The estimated domestic demand for potable water for the proposed entertainment complex will coincide with the projected sewage flows of 125,000 GPD. The required fire flow calculated by the project architect is about 650 gallons per minute (GPM).

The City of Bethlehem owns the water infrastructure in the project area. A 30" Cast Iron (CI) water main runs through the proposed project site. Copies of the City of Bethlehem's water utility maps K-6 and K-7 are located in Appendix B of this report. Carl Newswanger, Water Utility Engineer, who has been with the City's engineering department for over thirty-five years reported to us in an interview that the 30" water main has a flow rate of 3,000 gallons per minute (GPM) and a residual pressure of 80 pounds per square inch (PSI). He stated the City does not have any flow information on record of the water facilities within the Bethlehem Steel ore pit area, but recalls when they conducted flow tests that the results may not be adequate for fire protection.

The lack of capacity of the existing water system near the Bethlehem Steel ore pit area will not be an issue because this existing water system will be replaced with a new on-site water distribution system that will be connected to the City's 30" main. The connection to the 30" main will be integrated into the design of the final site plans for the entertainment complex.

The location of the existing City 30" main may ultimately conflict with the location of the proposed entertainment complex. This will be resolved by incorporating the relocation of the 30" main with the design of the entertainment complex water distribution system, during site plan design.

The information obtained by FPA to date would indicate that the 30" water transmission line near the proposed entertainment complex should adequately convey the flows needed to support the entertainment complex. The 30" pipes 3000 gallons per minute flow rate, (which equates to 4.3 million gallons per day) should supply the 125,000 GPD domestic demand required by the entertainment complex.

For this reason, the construction of the entertainment complex should have no adverse impact on the City of Bethlehem water distribution system.

C. Storm Sewer

The Pennsylvania Stormwater Management Act 167 was established to meet the requirements of the National Pollutant Discharge Elimination System (NPDES). The state has been divided by watershed and Act 167 was set up to provide improved management of stormwater runoff impacts associated with land development. The purpose of the Act was to encourage planning and management of stormwater runoff and to coordinate stormwater management efforts within each watershed. The Act ensures new problems are not created and existing drainage problems are not exacerbated.

The entertainment complex site is located in the Catasauqua Creek Watershed and Lehigh River Sub-Basin 4. This area is comprised of 6 unnamed creeks and 27 direct drainage sub-areas.

The area is divided into three stormwater management districts consistent with the Catasauqua Creek Release Rate Map in Appendix C. Three types of stormwater management districts may be applicable to the City, namely Conditional No Detention I Districts, Conditional No Detention II Districts and Dual Release Rate Districts.

A land development project within the Conditional No Detention I Districts areas may discharge stormwater runoff without detention facilities. No aboveground or belowground detention basins are required if the local storm sewer conveyance facilities have adequate capacity for the runoff of the proposed site.

In the Conditional No Detention II Districts, adequate capacity must be demonstrated by calculating the capacity of the receiving waters. The available capacity will determine if no detention or a 100% release rate will be required for the site.

In the dual release rate districts the 2-year post-development stormwater runoff must be controlled to 30% of the pre-development 2-year runoff peak. The 10-year, 25-year and 100-year post-development stormwater runoff must be controlled to 100% of the pre-development peak. Some type of detention will be required.

The design of proposed storm sewer for the casino will not require the use of a detention basin since the site falls in the Conditional No Detention District I. The new storm sewer system can be connected directly to the City's existing storm sewer system. The runoff controls used in the design will be based upon site characteristics such as topography, soils, geology, water table, etc. Water Quality Measures will also be required by the local Soil Conservation District. Based on the above characteristics the following Best Management Practice's (BMP's) will be integrated into the design of the storm sewer system for water quality; where appropriate:

- Infiltration Trench and Dry Well
- Grass Swale
- Water Quality Inlet
- Infiltration Chamber

The most favorable connection point to the existing storm sewer system will be determined as part of the design layout and analysis.

The former Bethlehem Steel site has storm sewer facilities in the project area (see Storm Drainage Maps in Appendix C). A 42" storm sewer runs along the southern property boundary near Daly Avenue. The 42" stormwater conveyance system enlarges to a 72" pipe and discharges into the Lehigh River from a 78" outfall.

From reviewing the storm drainage map, a possible connection point to the City storm sewer would be somewhere along the 72" pipe. The 72" pipe has a large conveyance capacity and it is likely that the entertainment complex drainage system could be designed to tie into this existing 72" pipe, therefore, not burdening the surrounding existing City stormwater collection system.

The proposed entertainment complex site is in close proximity of the Lehigh River. The runoff from the proposed site will most likely be discharged into the existing 72" storm sewer located on the site and, therefore, will have no impact on the City's storm sewer infrastructure.

3.0 CONCLUSION

Based on our analysis of record information made available through the City of Bethlehem, Bethlehem Steel, in-house files and conversations with various officials at the City and State level, we have concluded that the City wastewater treatment plant presently has the capacity to serve the proposed entertainment complex site. The City of Bethlehem's waste water treatment plant has approximately 400,000 gallons per day of capacity available. The proposed Phase I Development of the entertainment complex will require approximately 125,000 gallons per day. For this reason, the construction of the proposed entertainment complex should have no negative impact on the treatment plant. The necessary paperwork to reserve the capacity in the treatment plant for the entertainment complex has been filed with the City.

The proposed entertainment complex site, at the former Bethlehem Steel ore pit area, is in close proximity to the City's 66" sanitary sewer trunk line, which runs along the Lehigh River. A 42" line also runs through the ore pit area, and connects to the 66" trunk line. A portion of the former Bethlehem Steel site was connected to this sanitary sewer collection system, when it was in operation. According to the City, the former Bethlehem Steel site produced 5 million gallons per day of wastewater flows, which were conveyed to the City wastewater treatment plant through the collection system. Since the proposed entertainment complex is estimated to produce approximately 125,000 gallons per day of wastewater flows, the existing collection system should have the capacity to convey the projected wastewater flows from the entertainment complex. For this reason the construction of the entertainment complex will have no adverse impact on the City of Bethlehem sanitary sewer collection system.

The City of Bethlehem owns and operates the water transmission system at the proposed casino site. A 30" line runs through the property roughly parallel to the Minsi Trail Bridge. According to our research, this line should have adequate capacity to deliver the required domestic and fire flows to the site. The 30" line may have to be relocated as part of the construction of the entertainment complex, but this can be accomplished without interrupting service to the surrounding areas. For these reasons, the construction of the entertainment complex will have no negative impact on the City's water system.

The proposed entertainment complex site will not adversely impact the City's storm drain system. The reason for this conclusion is that the site lies adjacent to the Lehigh River, and existing stormwater outfalls to the river will be incorporated into the site design, when possible. It is anticipated that a new storm drain system will be used to collect stormwater on site, and that a minimum, if any, stormwater will be directed to the existing municipal storm drain system.

In summary, the findings of French and Parrello have indicated that the construction of the proposed entertainment complex will have no significant adverse impacts on the local stormwater, water distribution, or sanitary sewer system.

§ 73.17. Sewage flows.

(a) The flow figures in this subsection and subsection (b) are peak daily flows for the design of community onlot sewage systems. These flow figures are not intended to be used for the calculation of flows for the design of community sewerage systems or for the allocation of flows related to community sewerage systems. Design and permit sewage flows for a community sewerage system are to be calculated using the procedures established in the Department's ''Domestic Wastewater Facilities Manual.'' The sewage flow from single family dwellings served by a community onlot sewage system or from apartments, rooming houses, hotels and motels served byan individual or community sewage system shall be determined from the following table:

Type of Establishment	*Gallons/Unit/day*	
Residential	*Gallons/unit*	*BOD/unit*
Hotels and motels	100	.30
Multiple family dwellings and apartments, including townhouses, duplexes and condominiums	400	1.13
Rooming houses (per unit)	200	.60
Single family residences	400*	.90

*For units of 3 bedrooms or less; for each bedroom over 3, add 100 gallons.

(b) The sewage flow, which shall exclude any industrial waste, for nonresidential establishments served by an individual or community sewage system shall be determined from the following table:

Type of Establishment		
Commercial	*Gallons/day*	*BOD/day*
Airline catering (per meal served)	3	.03
Airports (per passenger—not including food)	5	.02
Airports (per employe)	10	.06
One licensed operator Beauty shops	200	—
Bus service areas not including food (per patron and employe)	5	.02
Country clubs not including food (per patron and employe)	30	.02
Drive-in theaters (not including food—per space)	10	.06
Factories and plants exclusive of industrial wastes (per employe)	35	.08
Laundries, self-service (gallons/washer)	400	2.00
Mobile home parks, independent (per space)	400	1.00
Movie theaters (not including food, per auditorium seat)	5	.03
Offices (per employe)	10	.06
Restaurants (toilet and kitchen wastes per patron)	10	.06
(Additional for bars and cocktail lounges)	2	.02
Restaurants (kitchen and toilet wastes, single-service utensils/person)	8.5	.03
Restaurants (kitchen waste only, single-service utensils/patron)	3	.01
Stores (per public toilet)	400	2.00
Warehouses (per employe)	35	—
Work or construction camps (semipermanent) with flush toilets (per employe)	50	.17

Work or construction camps (semipermanent) without flush toilets (per employe)	35	.02
Institutional		
Churches (per seat)	3	—
Churches (additional kitchen waste per meal served)	3	—

Type of Establishment		
Institutional	*Gallons/day*	*BOD/day*
Churches (additional with paper service per meal served)	1.5	—
Hospitals (per bed space, with laundry)	300	.20
Hospitals (per bed space, without laundry)	220	—
Institutional food service (per meal)	20	—
Institutions other than hospitals (per bed space)	125	.17
Schools, boarding (per resident)	100	.17
Schools, day (without cafeterias, gyms or showers per student and employe)	15	.04
Schools, day (with cafeterias, but no gym or showers per student and employe)	20	.08
Schools, day (with cafeterias, gym and showers per student and employe)	25	.10
Recreational and Seasonal		
Camps, day (no meals served)	10	.12
Camps, hunting and summer residential (night and day) with limited plumbing including water-carried toilet wastes (per person)	50	.12
Campgrounds, with individual sewer and water hookup (per space)	100	.50
Campgrounds with water hookup only and/or central comfort station which includes water-carried toilet wastes (per space)	50	.50
Fairgrounds and parks, picnic—with bathhouses, showers, and flush toilets (per person)	15	.06
Fairgrounds and parks, picnic (toilet wastes only, per person)	5	.06
Swimming pools and bathhouses (per person)	10	.06

(c) Actual water meter or sewer meter flow data indicating peak daily flows different than those shown in this section over a 1-year period for a similar nonresidential establishment may be accepted for use in sizing the onlot disposal system. If average daily flows are used, the peak daily flow shall be calculated by multiplying the average daily flow by two.

(d) Establishments with food preparation facilities are required to install adequately designed pretreatment units and traps to reduce greases and biological oxygen demand (BOD) prior to discharge to an individual or community sewage system.

Authority

The provisions of this § 73.17 amended under section 9 of the Pennsylvania Sewage Facilities Act (35 P. S. § 750.9); The Clean Streams Law (35 P. S. § § 691.1—691.1001); and section 1920-A of The Administrative Code of 1929 (71 P. S. § 510-20).

Bethlehem, Pennsylvania 18018

Re: **Will Serve Letter for Potable Water Services**
BethWorks Casino
Tax Map P6, Block 2, Lot 2
City of Bethlehem, Northampton County, Pennsylvania
FPA No. 04C155DC1

Dear Mr. Newswanger:

Please be advised that French & Parrello Associates, P.A. has been retained by the Las Vegas Sands Corporation to conduct a preliminary impact analysis for the construction of a proposed casino facility on the above site. The average daily projected sewage flows for the current plan are approximately 126,500 GPD. We are presently making the assumption that the average daily domestic water demand would also be 126,500 GPD. The required fire flow as estimated by the Architect is 650 GPM.

By this letter, we request confirmation from your department that you can meet the projected water demands of this project.

If at all possible, please expedite your review of the documents and information provided, as we are ready to proceed on this project.

If you have any questions or require additional information, please feel free to contact us.

Very truly yours,

FRENCH & PARRELLO ASSOCIATES, P.A.

Mark L. Reid /nja

Re: Beth Works Casino

Dear Mark:

In reply to your letter of November 23, 2005, City water service is available to the above-referenced project, subject to all rules, regulations and requirements of the City of Bethlehem. Since any water feeds to the new casino area will come from the existing 30" transmission main, the requirements of 126,500 GPD domestic demand and 650 GPM fire flow will be no problem whatsoever.

If there are any questions, please call me at 610-865-7076.

Yours Respectfully,

Carl F. Newswanger
Water Utility Engineer
